

## Gold Wing - GL1800 DCT - 2018 on

Please read and ensure you fully understand the Main Lift Instructions before commencing, if in any doubt please contact us for advice! 0182761754.

Place the two mounts onto the lifting arm using the measurements shown (Pic 1) Then lock them firmly and squarely into position with a 13mm wrench.

Next with the motorcycle on its side stand push the lift into and under the bike from the righthand side, ensure the Rear Beam sits firmly under the Solid Platform just ahead of the Centre Stand pivot point. (Pic 2 Top)

### **Important!**

Ensure that the Main (Blue) Lifting Arm is completely inline with the centre line of the bikes wheels, failure to observe this will be dangerous!

Position the Front Mount so that it is sitting correctly as shown (Pic 3 Bottom) with the cutout clearing the ridge in the centre of the crankcase.

(Note: There is No pressure applied to the side exhaust pipes!!)

Now, start turning the screw shaft clockwise while supporting the bike until the mounts make full contact and the bike is in a Vertical position.

Do a final check that the mounts are in the correct position and when satisfied continue to raise the bike to the desired height.

**Always use ratchet type (or similar) tie down straps to secure the bike to the lift!**

Below : Rear mount shown in correct position.

Below : Front mount shown in correct position.
