

Triumph Rocket 3R & GT - 2020 (New)

Please read and ensure you fully understand the Main Lift Instructions before commencing and if in any doubt please contact us for advice! 0182761754.

Place the two mounts onto the lifting arm using the measurements shown then lock them firmly and squarely into position with a 13mm wrench.

Next with the motorcycle on its side stand push the lift into and under the bike from the righthand side, ensure the mounts sit firmly and squarely under the engine crankcase.

Important!

Ensure that the Main (Blue) Lifting Arm is completely inline with the centre line of the bikes wheels, failure to observe this will be dangerous!

Now, start turning the screw shaft clockwise while supporting the bike until the mounts make full contact and the bike is in a **Vertical position**.

Do a final check that the mounts are in the correct position and when satisfied continue to raise the bike to the desired height.

Always use ratchet type (or similar) tie down straps to secure the bike to the lift from the four “Slots” provided.
